## 1 OVERVIEW

---

This specification is intended to document the requirements for using the Sandata Alternate EVV Interface (part of the Open EVV Series of Interface) for receiving information from 3rd party EVV Vendors into the Sandata Aggregator. This interface is also referred to as the Alternate EVV Data Interface or 'alt EVV'. An Alternate EVV Data Collection System will build one data pipe to the Aggregator and send synchronous data 'packages' per defined provider agency.

This interface includes 3 types of data: Visits, the Clients associated with those visits, and the Employees associated with those visits.

For additional information, please refer to the accompanying general specification. This document includes sample JSON for reference.

## 2 INTENDED AUDIENCE

---

The intended audience of this document is:

- Project Management and Technical teams at Sandata, and
- Project Management and Technical teams at designated Providers/Vendors who will be implementing this interface.

## 3 VENDOR TESTING

---

Vendors and Providers using a 3<sup>rd</sup> Party EVV system must utilize the Sandata EVV Vendor Self-Registration portal. This will allow you to register for testing for the selected state and proceed through the various test cases. All vendor products must go through testing at least once for each program.

Requirements for utilizing the portal:

- You must be a known vendor to Sandata.
- At least one provider must have identified your product as their intended EVV collection system for the program.

The portal can be found at <https://evv-registration.sandata.com/vendor-registration>.

## 4 TRANSMISSION INFORMATION

---

### 4.1 TRANSMISSION FREQUENCY

For optimal system performance, it is recommended that visits should be sent in near real time. It is expected that information is sent as it is added/changed/deleted in the Alternate EVV Data Collection.

System Note: Rejection responses will be delivered on a separate API call that is initiated by the third party—in near real time.

### 4.2 TRANSMISSION LIMITS

A single transaction may contain from 1 to 5,000 records. A single record set would include all associated elements. If the group size exceeds the maximum limit for the group, the complete group will be rejected.

During peak loads, records received may be queued and processed as resources permit. Other transactions received for the Provider ID will be queued behind these until they are processed since they are processed in the order received.

Expected result of queued data is...Error Message: “The result for the input UUID is not ready yet. Please try again.”

Expected vendor action: Wait 5 minutes before attempting the GET status response.

### 4.3 FILE DETAILS

#### 4.4 DATA TYPE FORMAT DETAILS

The user will send information in a JSON format. JSON allows multiple child entities for a parent.

The format of the information sent must match exactly the format defined below and must be sent via the web service. We support only three data types during transmission: string, number, and Boolean. The specification uses more traditional data types to ensure that data is received in the expected formats and appropriate record level editing can be incorporated. Except where numeric, the assumed JSON format is string. The data type provided in the specification is based on the following field definitions.

Note that the format is case sensitive. All field names must be provided in EXACTLY the casing used in the definitions below. Sandata utilizes RESTful services with JSON formatting.

Table 1: Data Type Basics

Data Type	Description	Example
DateTime	The <b>date</b> and <b>time</b> are represented as a string with the following format: YYYY-MM-DDTHH:MM:SSZ All times will be provided in UTC (Coordinated Universal Time <sup>1</sup> ).	2016-12-20T16:10:28Z
Date (Only Date)	The data is represented as a string with the following format: YYYY-MM-DD	2016-12-20
Timezone	All time for tracking visits will be in UTC. The time zone name expected in each transaction is the actual time zone where the event took place. i.e., US/Eastern.	See the Appendix for the Time Zone list. These are the values supported by Sandata EVV and the Sandata Aggregator.
String	A string is a row of zero or more characters that can include letters, numbers, or other types of characters as a unit, not an array of single characters. (e.g., plain text).	This is a string of characters. Some string fields limit the special characters that can be received.
Integer	An integer is a numeric value without a decimal. Integers are whole numbers and can be positive or negative.	52110 (positive) -87721 (negative)
Decimal	A floating-point number is referred to as a decimal. Can be positive or negative.	8221.231 (positive) -71.214 (negative)
Boolean	A logic predicate indicator that can be either true or false.	true false

## 4.5 REJECTED RECORD PROCESS

When records are received, Sandata will return for each group a transaction ID and an ACK (acknowledgment of receipt). This transaction ID can be queried by the caller for status of the records in the transaction. This process will allow the provider/vendor to “GET status” on any of the records that may have been rejected. The example below is shown for an employee record.

<sup>1</sup> The UTC Standard is based on the GMT time zone.

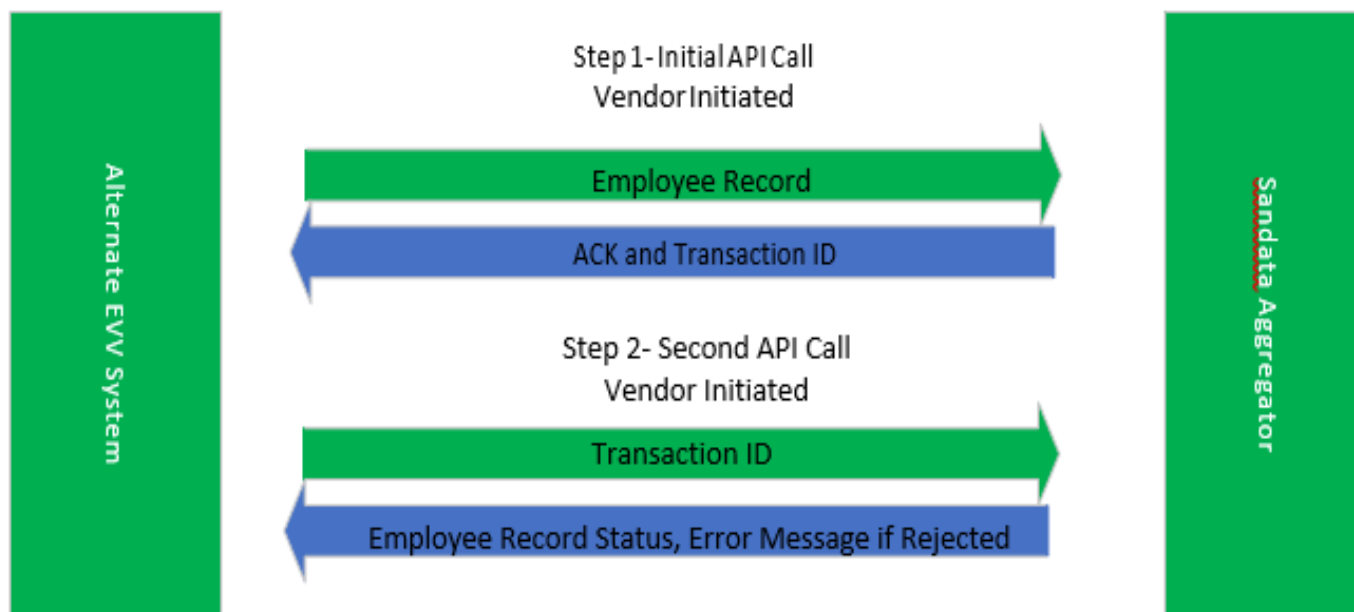

Figure 1: Transmission Process

#### 4.6 NEW RECORD AND UPDATES

New records and updates for previously sent data should be provided via the clients, employees, or visits interfaces ('data packages'). If a set of records is sent (client, employee, or visit), all associated elements should be sent. Partial updates will be rejected. An update that deletes a record will, in most cases, not actually remove information since Sandata will not physically delete information. The deleted record/s will no longer be visible on the application. However, the record history will maintain the original data received.

#### 4.7 TRANSMISSION METHOD

Sandata supports an SOA architecture. Sandata will provide an API for 3rd party vendors or agency's internal IT organizations to utilize. Sandata can provide sample JSON format information, as well as the WADL to those parties developing the interface. This specification will include the REST endpoints needed to request status on record acceptance /rejection.

## 4.8 RULES

The following rules apply to information received through this interface. For all rules that result in a rejection, it is expected that the issue will be resolved in the Alternate Data Collection System and the information subsequently retransmitted.

There is one set of Interfaces per Sandata Provider Agency and program.

There will be 3 independent types of data provided through the Alternate EVV interface.

- Clients
- Employees (Field Staff)
- Visit Information

Each will be sent individually but can be delivered through the same single connection.

### THE ALTERNATE DATA COLLECTION SYSTEM WILL BE RESPONSIBLE FOR:

- Visit transmittals: Visits should be transmitted in near real time. Actual payer frequency requirements may vary. Note that rejection responses will be delivered as separate API calls initiated by the third party. Information should be sent for only those records that are added, changed, or deleted. This is an incremental interface. Records which have not changed should not be resent.
- Complete transmissions:
  - When sending a client, all applicable elements and sub elements must be sent during each transmission.
  - When sending an employee, all applicable elements and sub elements must be sent during each transmission.
  - When sending a visit, all applicable elements and sub elements must be sent during each transmission.
- Call matching: Calls received regardless of the collection method used by the Alternate Data Collection System are received together as part of a complete visit by the Aggregator, per the specification. Sandata will not attempt to match or rematch the visits received.
- Data quality: All data will be accepted from third party data “as is,” including any calculated fields.
- Latitude and longitude must be provided for both the visit start and visit end time, assuming it is collected via a GPS-enabled device.
- Assigning sequence numbers: For each of the 3 types of records (client, employee, visit), the Alternate Data Collection System will be responsible for assigning sequence numbers for each interface to ensure that updates are applied in the appropriate sequence. If a record is rejected, an incremented sequence is expected on the next transmission of that record set. Sequence numbers are per unique record (client, employee, visit) and record set (modifications to the same client, employee, visit). For example, the first time a particular client is sent, the sequence would be set to 1. The second time that same client is sent, the sequence would be set to 2, etc.
- Ability to correct defined exceptions: Exceptions must be corrected using the standard set of reason codes provided by Payer/State. Some of the defined reason codes require additional text to provide additional information; this information must also be sent as part of this interface.
- Change log transmission: Changes made to all visit information must be fully logged, and the log information must be transmitted as part of the visit record, as applicable. The log must be completed in the VisitChanges segment.

- Standard date/time format: All dates and times provided must be sent in UTC (Coordinated Universal Time) format which uses GMT.

#### **GENERAL PROCESSING RULES:**

- If a record is received and any required data is missing, malformed, or incomplete as defined in the specification, the record will be rejected or set to default values in accordance with the detailed specifications.
- If an optional field is provided with an invalid value (one not listed in this specification), the field will be set to the default value, null and/or rejected depending on the field, unless otherwise specified in this specification.
- If text (string) field length is longer (>/greater than) than the maximum allowed for that field value, unless otherwise noted, the field will be truncated to the maximum length specified for that field.
- Any record without a sequence number will be rejected. Sequence numbers are per unique record (client, employee, visit). For example, the first time a particular client is sent, the sequence would be set to 1. The second time the same client is sent, the sequence would be set to 2, etc.
- Records will be processed in the order received using the assigned sequence number.
- If the record is received with a sequential number that is less than the one already processed, the data will be rejected with error “Version number is duplicated or older than current.” The vendor must correct the SequenceID and resend the data.
- Header information as determined for the payer and program must be included in each transmission for each record (client, employee, visit), otherwise the entire collection of records will be rejected.

#### **STANDARD CLIENT RULES:**

The following represents a subset of the requirements for client information. Please see the Field Information section of this document for all applicable rules.

- If the client does not include at least 1 complete address (address line 1, city, state, zip code) the client will be rejected.
- If the client does not include the defined unique identifier, the client will be rejected.
- If the client does not include first name, last name and time zone, the client will be rejected.

#### **STANDARD EMPLOYEE RULES:**

The following represents a subset of the requirements for employee information. Please see the Field Information section of this document for all applicable rules.

- If SequenceID and Staff ID are not provided, the employee will be rejected.
- If an employee's first name and last name are not provided, the employee will be rejected.

## STANDARD VISIT RULES:

- Clients and Employees must be sent before visits, to ensure they exist in the Sandata system at the time of visit receipt. If the client and employee have not been received in the Sandata system, the visit will be rejected.
- No Client Provided - To allow the Aggregator to determine if the visit is for a Payer/State client, the visit must include a client. If a visit does not include a client, the complete visit will be rejected.
- Invalid/Unknown Client Provided - To allow the Aggregator to determine if the visit is for a Payer/State Client, the visit must include a valid client associated with the payer. If a visit includes a client that is unknown to Sandata (has not been received and accepted), the complete visit record will be rejected.
- No Employee Provided / Invalid or Unknown Employee Provided - If a visit does not include an employee (visit record send without an employee associated), The visit will be rejected as 'Worker not found'. The data will not process with an 'Unknown Employee' exception in Aggregator.
- The Alternate EVV system is expected to be able to handle a visit that crosses calendar days.
- A visit can only be cancelled if it does not have any calls associated with it or any adjusted times (generally a scheduled visit) and the schedule has not yet started. If a visit has calls but is being cancelled in the source EVV system, the "Bill Visit" indicator should be set to False to indicate that the visit should be disregarded for billing purposes. The visit status will be set to Omit by the Aggregator.
- The following rules apply to the dates and times provided for the visit.

Date and Time Exists for the Following				Rule
Call In	Call Out	Adjusted In	Adjusted Out	
x	x			Call Out must be > Call In  Otherwise record rejected.
Superseded by Adj. In	Superseded by Adj. Out	x	x	Adj. Out must be > Adj. In  Otherwise record rejected.
x	Superseded by Adj. Out		x	Adj. Out must be > Call In  Otherwise record rejected.

Date and Time Exists for the Following				Rule
Call In	Call Out	Adjusted In	Adjusted Out	
Superseded by Adj. In	x	x		Call Out must be > Adj. In  Otherwise record rejected.

Figure 2: Call and Adjusted Time Precedence

Upon receipt, Sandata will calculate all configured Payer/Program exceptions and apply those exceptions as applicable.

It is assumed that there are some exceptions that cannot be “fixed” in the Alternate Data Collection System by their nature. They are configured for the Payer/State program as requiring acknowledgement by the system user. One of the included visit elements provides the ability for the user to send their acknowledgement. These exceptions require attestation that the exception has been reviewed/acknowledged in the system along with the appropriate reason code and attestation that appropriate documentation exists. Exceptions are specific to a given Payer/Program and will be noted in the associated appendix.

Upon receipt, Sandata will calculate and apply visit status as defined for the Payer/Program.

The Alternate Data Collection System will be expected to send a reason code and optionally the defined resolution code if it applies to the payer. Based on the definitions of the reason codes, some reason codes require additional information explaining the change. If additional information is required, the alternate data collection system must collect the information and include it when transmitting the visit to Sandata.

## 4.9 SEQUENCING

The SequenceID on all three types of records (clients, employees, visits) should be independent per record and should be incremented each time any record is sent. The Sequence ID will be used to ensure that a record is processed only once and that the most current information is used for reporting and claims processing. In the event a visit update is not accepted (rejected), the SequenceID on that transmission should not be reused. The next update should increment to the next number in the sequence. Failure to do so will cause the new record to be rejected as a duplicate.

Sequence Rules:

- If the latest SequenceID is greater than the highest value previously received, the record set will not be rejected. For example, if the latest SequenceID = 5, and the previous SequenceID = 4, the new record is accepted and displayed.
- If the latest SequenceID is less than the value previously received, and the record has not yet been processed, it will not be applied. For example, if the latest SequenceID = 8, and the previous SequenceID = 10 Record was accepted, the record sent with SequenceID 10 will be considered the current record.

- If the Sequence ID is equal to a value previously received, it will be rejected. i.e., latest SequenceID = 15, previous SequenceID = 15  
Record rejected.
- Gaps in sequence will be allowed.

**Please Note:**

*For those agencies that wish to use the Alternate EVV interface, and would prefer to use timestamps as the sequence number in their deliveries, the Sandata system can accept the timestamp value as the sequence number, under two conditions:*

- 1. The timestamp value provided must contain only numbers, and no other symbols (i.e. “/”, “-”, and “:” characters removed)*
- 2. The timestamp value provided must be formatted as YYYYMMDDHHMMSS. For example:*

## 5 EVV - ELEMENTS

As part of the implementation process, required fields may be adjusted and the available fields may be increased or reduced based on the program specifics. If you are sending fields which are not required, unless specifically noted, Sandata will accept and display these values.

Conditional means if it is present then it is required.

For each of the 3 endpoints, the Provider Identification segment is required.

Values shown in quotes in the Expected Value column indicate that this is a literal value where the word in quotes should be provided.

Information which is specific to Massachusetts is highlighted in blue.

### 5.1 PROVIDER INFORMATION (ALL ENDPOINTS)

This segment needs to be provided for all 3 endpoints to identify the provider for whom the information is being provided.

#	Element	Description	Max Length	Type	Required?	Expected Value and Rules
<b>Segment - ProviderIdentification - Required for the Client, Employee and Visit Endpoints</b>						
1	ProviderQualifier	Unique identifier for the provider as determined by the program definition.	20	String	Yes	Send the literal value 'Other'.
2	ProviderID	Unique identifier for the agency. ID type must match to the ProviderQualifier value being passed for Provider validation and lookup.	50	String	Yes	Should be the 9-Digit Identifier for the Provider  This is the first 9 digits of the MA known PIDSL

## 5.2 CLIENT DATA ENDPOINT

This endpoint receives information regarding the individual member/beneficiary (known here as the 'Client') that receives care as part of the visit. Please note - the Client record must be successfully delivered and loaded PRIOR to the delivery of the Visit information, or else the visit will be rejected due to "Client not found".

For the Massachusetts program, it is expected that all clients will be sourced from the State MMIS system. When this record is received, the matching record in the MMIS system will be located using the ClientIdentifier (MID or EOEA ID) plus the client's date of birth. If a match record is not found in the State system, the record will be rejected along with any associated visits to be received.
